THE RIVER MUST LIVE • 21 min.

From microscopic detail of the biological processes involved to the tragic end results, "The River Must Live" is a beautiful photographic essay of the causes, effects and solutions of water pollution.

Plant and animal life have always left decay in rivers and microscopic organisms have always thrived on it—they are nature's way of cleaning things up. But the ever increasing accumulation of man-made waste stimulates bacterial action, robbing the water of oxygen—sometimes to the point where everything dies and the river becomes putrid. The film stresses that indiscriminate discharge of effluents is squandering man's most valuable natural resource—water.

Recommended for general high school and college use and particularly adult groups interested in conservation of natural resources.

THE FOSSIL STORY

19 min.

The oil that will provide energy for the future will be found by means of clues from the ancient past. Oil was formed during the early history of the earth, and today's scientists know that fossils serve as clues to places where oil might be. The fossils themselves,

earth-locked remains of huge creatures and tiny organisms that lived hundreds of millions of years ago, are featured in sequences of remarkable quality.
